\* Estimates are considered unreliable. Data not shown have an RSE greater than 30%.

<sup>1</sup> Starting with 1999 data, race-specific estimates are tabulated according to the 1997 *Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity* and are not strictly comparable with estimates for earlier years. Prior to 1999, data were tabulated according to the 1977 Standards with four racial groups, and the Asian only category included Native Hawaiian or Other Pacific Islander. Estimates for single-race categories prior to 1999 included persons who reported one race or, if they reported more than one race, identified one race as best representing their race. See Appendix II, Hispanic origin; Race.

<sup>2</sup> Questions concerning use of mammography differed slightly on the National Health Interview Survey across the survey years. See Appendix II, Mammography. Data prior to 1997 are not strictly comparable with data for later years due to the 1997 questionnaire redesign.

<sup>3</sup> Adults with a colorectal test or procedure are those who reported a home fecal occult blood test (FOBT) in the past year, a sigmoidoscopy procedure in the past five years with FOBT in the past three years, or a colonoscopy in the past 10 years. Questions concerning colorectal testing differed slightly on the National Health Interview Survey across survey years. See Appendix II, Colorectal tests or procedures.

<sup>4</sup> Colorectal cancer testing data begin in 2000 due to changes in available procedures prior to 2000.
